Load Cell

Exploring Load Cell Calibration and Measurement

1. Why can we assume a linear model for the load cell calibration?
2. How was raw data signals used to measure weight in this lab?
3. What are possible sources of error in load cell calibration and measurement?
4. After calibration, how accurate was the load cell when weighing a known object?
5. Why is signal averaging or filtering (e.g., moving average) important before applying the calibration model?
6. How does the spec sheet's nominal output (in mV/V) compare with your experimentally measured sensitivity from calibration?

Load Cell Cheat Sheet

What is it?	
What does it measure directly?	
What can you measure indirectly?	
Where are they used?	
Pros	
Cons	
Notes/ Important things to remember
